

High Pressure Carbon Dioxide

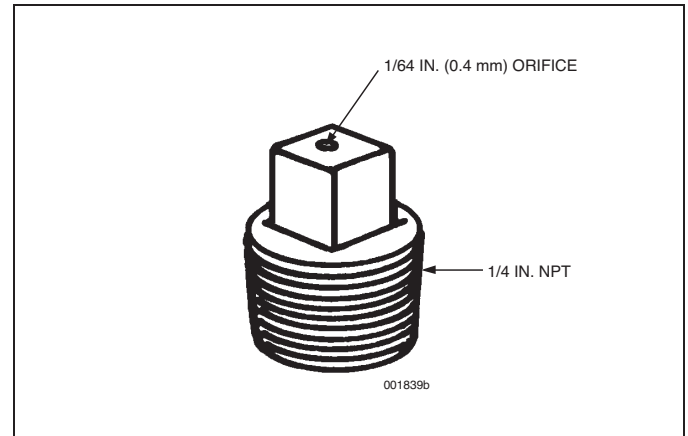

Pressure Bleeder Plug – 1/4 in.

Description

The pressure bleeder plug can be used to relieve the pressure in closed actuation lines. The plug relieves the pressure through a small 1/64 in. (0.4 mm) orifice. This slow relief of pressure does not affect the function of the actuation line.

- ▶ This device must not be installed in the actuation line of a pressure-operated selector valve. Such use may prevent proper operation of the selector valve.
